How to perform a speed test from my modem

-

- This speed test provides speeds for both download (to your modem) and upload (to the Internet). It temporary disables all local network activity so that the results reflect more closely the speeds you’re subscribed to.
1. Open your web browser and visit [bell.ca/mymodem](#) or **192.168.2.1**.
  2. Click **Speed test**.
  3. If prompted, enter the administrator password
    - Unless you’ve changed it, the password **is the serial number located on the sticker on the back** of the modem.
  4. Select **Block all local network** activity to temporarily disable network activity that could impact the results.
  5. Click **Start test**.
  6. A warning will appear that Internet, home phone and TV services (including shows being recorded) may be disrupted during the speed test. Click **Continue** if you wish to do so.  
Note: This will disable Fibe Internet for the duration of the test.
  7. Wait for the speed test to be completed.
